## Homework 9: Animations Tutorial and Demo

**Concept & Tutorial:** This demo shows users how to implement animations onto their websites using animate.css and aos.css. These libraries can be tricky to use, especially for people who have never used libraries before. For each library, I went step-by-step to show the user how to implement the library onto their existing code, how to animate the desired element, and how to customize the animation. I went through a demo example and then showed the user what the final webpage would look like after implementing the animation code.

**Demo:** For my demo, I created a webpage with a title and information underneath using HTML and CSS. Throughout my tutorial, I edited this demo code to show users how to implement animation using either animate.css or aos. The final product was a webpage with the title animated using animate.css and the contents toward the bottom of the page animated by aos. It is uploaded on my Github.
